

There has thus been described a method and apparatus of differential coding for use in bursty transmission networks which greatly improves the quality of transmitted compressed information. Although the present 5 invention has been described in terms of preferred embodiments, it will be appreciated that various modifications and alterations might be made by those skilled in the art without departing from the spirit and scope of the invention. The invention should, therefore, be mea-10 sured in terms of the claims which follow.

What is claimed is:

1. For use in a communications network having a plurality of nodes wherein a node may encode real-time information for propagating over said network, a 15 method of processing said real-time information comprising the steps of:

providing said node with a plurality of output buffers; (a) electronically capturing said real-time information and converting it into electronic data;

(b) differentially encoding said electronic data using a previously stored transmit reference image as a base to produce differential data;

(c) storing said differential data in one of said plurality of output buffers;

(d) monitoring said network for access to propagate said differential data:

repeating steps (a)-(d) until said node may propagate said differential data over said network;

transmitting data over said network from the one of said plurality of output buffers providing a best differential data to a receiving node on said network, wherein said best differential data represents a differential data whose use in conjunction with the previously stored transmit reference image produces an image that approximates a current frame better than use of other differential data contained in said plurality of output buffers; and

calculating a new transmit reference image based on said best differential data and said previously stored transmit reference image.

	SUE	· CAE	
	1	2	Anapparatus comprising:
	2		an encoder for producing encoded real-time information;
	3		a transmit reference buffer for storing a current transmit reference;
	4		compression circuitry coupled to the encoder and to the transmit reference buffer for
	5		producing compressed data based upon the current transmit reference and
	6		the encoded real-time information;
	7		a plurality of output buffers coupled to the compression circuitry for storing the
	8		compressed data; and
	9		a network interface coupled to the plurality of output buffers, the network interface
	10		for interfacing with a network, for determining a selected output buffer from
	11		the plurality of output buffers and for transmitting data over the network
i D	12		from the selected output buffer, the selected output buffer containing
M	13		compressed data which accommodates one or more characteristics of the
	14		network better than at least compressed data in another buffer of the
	15		plurality of output buffers.
J	1	3.	The apparatus of claim 2, wherein the selected output buffer contains compressed
	2	<u> </u>	
SNE	3		data which accommodates one or more characteristics of the network better than
	<i>-</i>		compressed data in all other buffers of the plurality of output buffers.
	E CAR	4	An apparatus for transmitting real-time information over a network, the apparatus
	2		comprising:
	3		an encoder for producing encoded real-time information;

a transmit reference buffer for storing a current transmit reference:

the encoded real-time information; and

compression circuitry coupled to the encoder and to the transmit reference buffer for

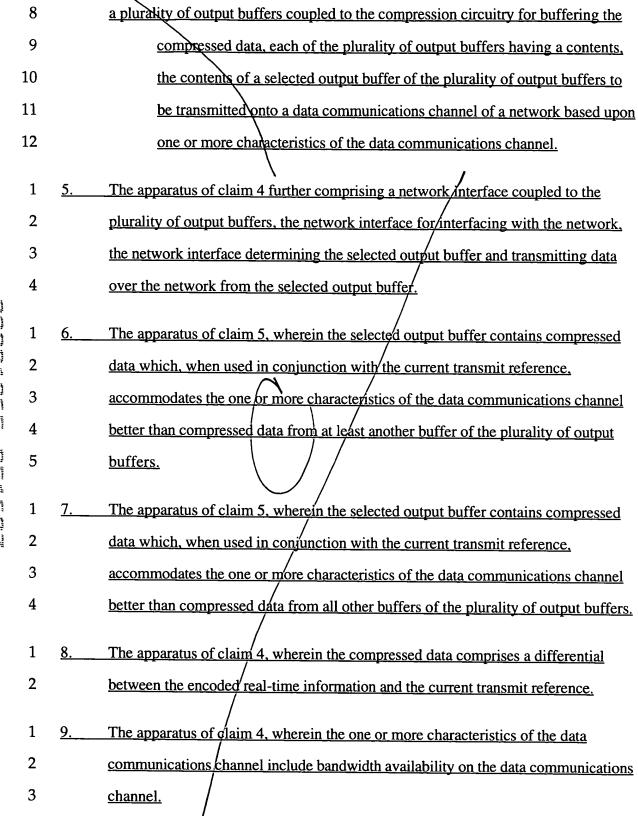

producing compressed data based upon the current transmit reference and

Ž	

1	<u>10.</u>	The apparatus of claim 4, wherein the one or more characteristics of the data
2		communications channel include burstiness of traffic on the data communications
3		channel.
1	11	The apparatus of claim 4, wherein the one or more characteristics of the data
2		communications channel include transmission delay on the data communications
3		channel.
1	12.	The apparatus of claim 4 wherein the encoded real-time information includes video
2		information.
1	<u>13.</u>	The apparatus of claim 4, wherein the encoded real-time information includes audio
2		information.
1	<u>14.</u>	An apparatus for transmitting real-time information over a network, the apparatus
2		comprising:
3		an encoder for producing encoded real-time information;
4		a transmit reference buffer for storing a current transmit reference;
5		compression circuitry coupled to the encoder and to the transmit reference buffer for
6		producing compressed data based upon the current transmit reference and
7		the encoded real-time information; and
8		a plurality of output buffers coupled to the compression circuitry, the plurality of
9		output buffers for storing the compressed data to be transmitted onto the
10		network from one of the plurality of output buffers.
1	<u>15.</u>	An apparatus comprising:
2		an encoder for producing encoded real-time information;
3		a transmit reference buffer for storing a current transmit reference;

4		compression circuitry coupled to the encoder and to the transmit reference buffer for
5		producing compressed data based upon the current transmit reference and
6		the encoded real-time information;
7		a plurality of output buffers coupled to the compression circuitry for storing the
8		compressed data; and
9		a network interface coupled to the plurality of output buffers, the network interface
10		for selecting a selected output buffer of the plurality of output buffers by
11		determining, with reference to one or more predetermined coding strategies,
12		whether compressed data from the selected output buffer is appropriate for
13		transmission to a receiving node.
1	<u> 16.</u>	The apparatus of claim 15, wherein the one or more predetermined coding strategies
2		include minimizing artifacts.
1	<u>17.</u>	The apparatus of claim 15, wherein the one or more predetermined coding strategies
2		include allocating available bandwidth to achieve a higher frame rate.
1	<u>18.</u>	An apparatus comprising:
2		an encoder for producing encoded real-time information;
3		compression circuitry coupled to the encoder for producing compressed data based
4		upon a previously stored transmit reference and the encoded real-time
5		information;
6		a plurality of output buffers coupled to the compression circuitry for storing the
7		compressed data; and
8		a network interface coupled to the plurality of output buffers, the network interface
9		transmitting compressed data from a selected output buffer of the plurality
10		of output buffers, the compressed data from the selected output buffer when
11		used in conjunction with the previously stored transmit reference
12		approximating a next frame expected by a receiving apparatus.

	1	<u> 19.</u>	A method of transmitting data over a network comprising the steps of:
	2		encoding the data by determining the differences between the data and a transmit
	3		reference to produce differential data;
	4		storing the differential data in one of a plurality of output buffers;
	5		selecting one of the plurality of output buffers as a current transmit buffer based
	6		upon one or more characteristics of a data communications channel of a
	7		network; and
	8		transmitting differential data from the current transmit buffer over the network.
	JE F	1 <u>3</u>)	A method of transmitting real-time data over a network comprising the steps of:
	2		encoding the real-time data by determining the differences between the real-time
in L	3		data and a transmit reference to produce differential data;
	4		storing the differential data in one of a plurality of output buffers;
	5		selecting one of the plurality of output buffers as a current transmit buffer by
	6		determining whether the differential data in a particular transmit buffer
	7		accommodates the one or more characteristics of the network better than
	8		differential data in at least another buffer of the plurality of output buffers;
•	9		<u>and</u>
	10		transmitting differential data from the current transmit buffer over the network.
